Google Scholar

- **Research directions:** AI-native wireless communications, cooperative LEO satellite MIMO networks, MU-MIMO/XL-MIMO, precoding, deep learning, CSI acquisition, feedback, and prediction.
- **Publication record:** 48 papers: 26 published journal articles, 1 under review, 12 conference papers, and 9 preprints.
- **Lead and co-first-author record:** JSAC ×1, TWC ×3, TCOM ×1, IEEE Wireless Communications ×1, WCL ×2; one additional manuscript under review at an IEEE Transactions journal; co-first-author TVT ×1. First-author conference papers: IEEE GLOBECOM ×1 and IEEE VTC ×1.
- **Google Scholar (as of Oct. 20, 2026):** 325 citations, h-index 11, and i10-index 15.

Education

Southeast University, National Mobile Communications Research Laboratory — Nanjing, China
Ph.D. Candidate, advisor: Prof. Wenjin Wang — Mar. 2023–Present
Research focus: My doctoral research investigates intelligent multi-satellite cooperative transmission, exploiting statistical CSI and structural symmetries to develop scalable transceiver designs for non-terrestrial networks.

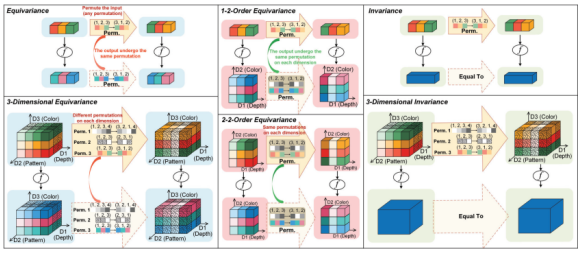

University of Luxembourg, SnT — Luxembourg
Visiting Ph.D. Researcher, advisor/collaborator: Prof. Bjorn Ottersten — Dec. 2024–Dec. 2025
Research focus: At SnT, I studied how synchronization errors and intersystem interference shape cooperative LEO transmission, developing distributed precoding and beamspace MIMO methods for network-scale operation.

Southeast University, National Mobile Communications Research Laboratory — Nanjing, China
M.E., Information and Communication Engineering, advisor: Prof. Wenjin Wang — Sep. 2021–Mar. 2023
Research focus: My master's research addressed reliable multiuser MIMO transmission under receiver and channel uncertainty, leading to work on constructive-interference precoding, coded soft demodulation, and channel-aging robustness.

Tianjin University — Tianjin, China
B.E., Communication Engineering — Sep. 2017–Jul. 2021
Research focus: My undergraduate training combined communication engineering with mathematical modeling and concluded with a GPA of 3.85/4.00, ranked 3rd among 129 students.

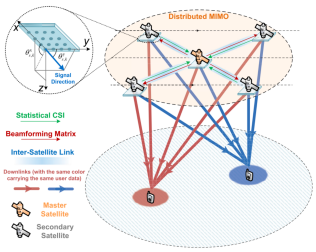

Selected Research Highlights

AI-native MU-MIMO

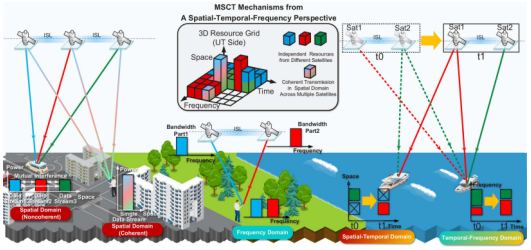

Tensor equivariance AI Framework
A general wireless-native AI framework exploiting high-dimensional, higher-order equivariances and invariances intrinsic to wireless communication tasks.
IEEE TWC, 2025. Code: TENN Toolbox.

Cooperative satellite MIMO

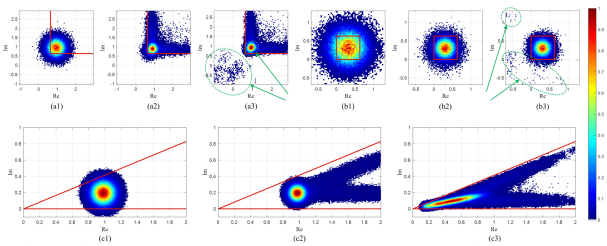

Statistical-CSI-based distributed precoding
Distributed precoding for OFDM-cooperative multi-satellite systems with statistical CSI and synchronization error modeling.
IEEE JSAC, 2026.

Multi-LEO cooperation

Spatial-temporal-frequency view of MSCT
Systematized multi-LEO cooperative transmission from spatial, temporal, and frequency domains, linking coherent/noncoherent modes to 6G NTN design.
IEEE Wireless Communications, 2026.

Coded SLP transceiver

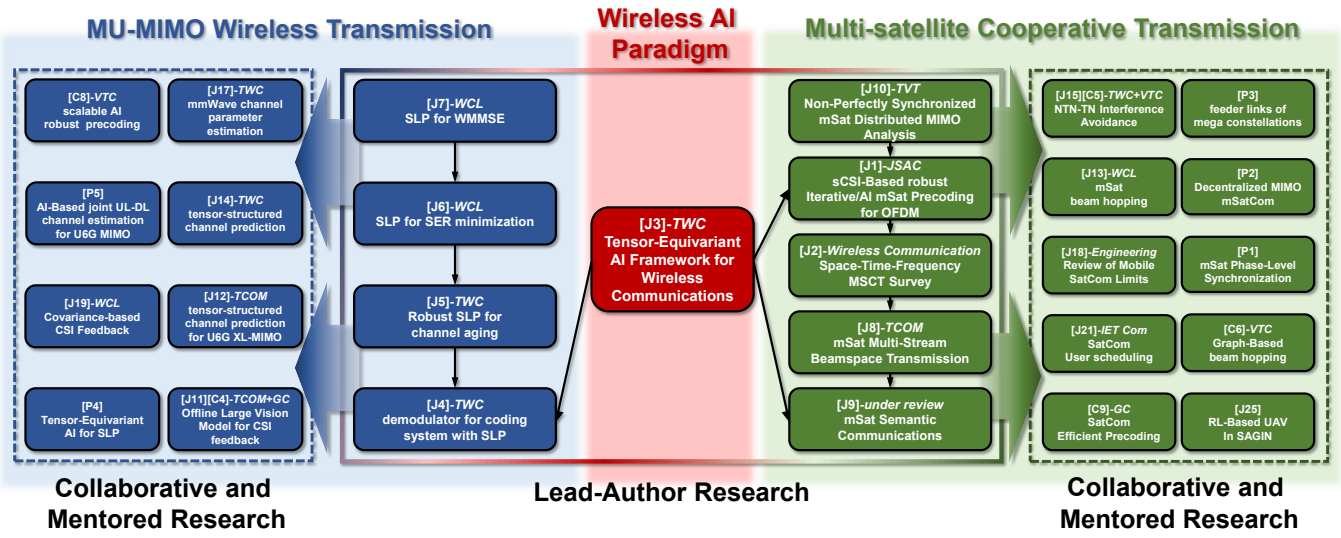

Soft demodulation for coded SLP systems
A soft-demodulation framework for coded multiuser MISO systems with symbol-level precoding, addressing non-Gaussian received signals.
IEEE TWC, 2024.

Research Trajectory Map

This map organizes my work into three connected research routes. The central solid region foregrounds the lead-author research that defines my academic profile, while the dashed outer branches place collaborative and mentored extensions around the two application routes. [J]/[C]/[P] refer to the journal, conference, and preprint paper list below. My early SLP research established a foundation in robust precoding and transceiver design. Building on this foundation, my current work advances along two application directions: AI-native MIMO and intelligent multi-satellite networks. Tensor-equivariant wireless AI provides a common modeling principle for both directions, enabling structure-aware learning across their distinct transmission problems.

- **Route 1 – MU-MIMO wireless transmission.** My lead-author work forms a continuous SLP line from WMMSE design [J7], to average-SER minimization [J6], robustness to channel aging [J5], and soft demodulation for coded SLP [J4]. It expands toward learning-aided precoding, large AI model for CSI feedback, CSI acquisition through channel parameter estimation and tensor-structured prediction.
- **Route 2 – Multi-satellite cooperative transmission.** This line progresses from distributed-MIMO modeling under imperfect synchronization [J10], to statistical-CSI-based robust/AI precoding for OFDM [J1], a space-time-frequency MSCT framework [J2], multi-stream beamspace transmission [J8], and semantic multi-satellite MIMO [J9]. Its extensions address cooperative-network architecture and operation, including interference management, feeder links, beam hopping, decentralized transmission, synchronization, and resource scheduling.
- **Route 3 – Wireless AI paradigm.** The tensor-equivariant framework [J3] identifies the permutation and tensor symmetries shared by MU-MIMO and multi-satellite mappings. It provides a common model-design principle for structured, scalable learning, supporting intelligent SLP and receiver design on the MU-MIMO route as well as distributed precoding on the multi-satellite route.

Abbreviations used in the map: AI, artificial intelligence; CSI, channel state information; MU-MIMO, multi-user multiple-input multiple-output; SLP, symbol-level precoding; WMMSE, weighted minimum mean-square error; OFDM, orthogonal frequency-division multiplexing; mSat/MSCT, multi-satellite/multi-satellite cooperative transmission; NTN/TN, non-terrestrial/terrestrial network; SatCom, satellite communications; SAGIN, space-air-ground integrated network; UAV, unmanned aerial vehicle; RL, reinforcement learning; mmWave, millimeter wave.

Open Source and Professional Service

- **Professional service**: Lead organizer of a special session at IEEE SPAWC 2026. Reviewer for TWC, TCOM, TMC, IEEE Wireless Communications, TVT, WCL, and related IEEE journals.
- **Open-source code**: TENN Toolbox, a Python/PyTorch implementation for tensor-equivariant neural networks in MU-MIMO precoding and user scheduling.

Honors, Awards, and Skills

Honors and awards

- National Scholarship for Doctoral Students, Ministry of Education of China, 2025 (RMB 30,000 / approx. USD 4,430, awarded annually to 2.65% of doctoral students nationwide).
- Huawei Scholarship for Doctoral Students, Huawei Technologies and Southeast University, 2025–2026 (RMB 10,000 / approx. USD 1,480, awarded annually to approximately 1.14% of SEU doctoral students).
- Zhangjiang Hi-Tech Award Fund, Southeast University, 2024–2025 (RMB 10,000 / approx. USD 1,480, one doctoral recipient, representing approximately 0.14% of doctoral students in the school).
- Academic Innovation Advanced Individual, Southeast University, 2023–2024 and 2024–2025 (received in two consecutive academic years, with annual recipients capped at 1% of eligible graduate students).
- SEU Innovation Capability Enhancement Plan for Doctoral Students, 2025–2026 (a university-level competitive doctoral research grant totaling RMB 60,000 / approx. USD 8,870, awarded on the basis of research achievements and potential).
- National Second Prize, China Post-Graduate Mathematical Contest in Modeling, 2021 (awarded to 10.6% of participating teams nationwide).
- Wiley Open Science Excellent Author Program, Apr.–Jun. 2023 (paper ranked among the journal's five most-downloaded China-authored articles of the quarter within three months of publication).

Technical skills and methods

- Wireless: precoding, beamforming, LEO satellite communications, CSI acquisition/feedback, MU-MIMO, XL-MIMO, OFDM.
- Methods: deep learning, convex/nonconvex optimization, manifold optimization, Bayesian estimation.
- Tools: MATLAB, Python, PyTorch, wireless-system simulation, numerical optimization, LaTeX.
